

UDEEP CHOWDARY NARIPEDDI

Complete visual redesign specification and implementation prompt for Antigravity. Reframe the portfolio from a neon AI dashboard into a typography-first editorial engineering identity built around black, white, and red.

DESIGN LANGUAGE Editorial / Brutalist / Engineering	THEME Obsidian dark / Paper light
DISPLAY Syne 700-800	BODY Instrument Sans 400-500
MONO IBM Plex Mono 400-500	ACCENT Red as signal, not decoration

IMPLEMENTATION PRINCIPLE

Keep the real data, links, theme switching, smooth scrolling, project functionality, GitHub activity, contact form, and terminal capability. Replace the visual architecture around them.

This is a full visual-system redesign, not a color swap.

The current repository describes itself as a computational AI research console with obsidian slate surfaces, electric cyan, deep violet, glass panels, pill geometry, telemetry, and interactive terminal behavior. The current CSS confirms the same system: cyan/violet signal colors, glassmorphism, 18px cards, fully rounded buttons, and a centered section-title pattern. The redesign should deliberately move away from that visual grammar.

Verified repository context

Area	Current implementation to preserve / refactor
Stack	React + Vite + CSS; Framer Motion; Lenis; Lucide icons.
App shell	App.jsx wraps Lenis, SpotlightBackground, Navbar, routes, lazy Terminal, BackToTop.
Global styling	index.css currently owns theme variables, glass panels, pill buttons, section title and accessibility rules.
Content structure	Home page composed from Hero, Projects, Skills, Journey, GitHub, Certifications and Contact-style components.
Functional features	Dark/light theme, terminal, GitHub activity, project links, contact form, responsive behavior and reduced-motion support.

The repository remains the source of truth for personal facts, project names, metrics, URLs, certifications, and achievements. The visual redesign must never invent or rewrite factual content just to fit a layout.

Primary redesign goal

- + Replace dashboard aesthetics with an editorial engineering portfolio.
- + Make typography, whitespace, rules, scale and asymmetric composition do most of the visual work.
- + Use red as a controlled signal for emphasis, status, active states and calls to action.
- + Make projects and proof of work the dominant content hierarchy.
- + Make the light and dark themes feel like two moods of the same identity, not two unrelated palettes.

REDLINE / EDITORIAL ENGINEERING

The portfolio should feel like a high-end design journal made by an engineer: precise, bold, slightly raw, but still highly usable. The design should communicate craft before effects.

Dimension	Direction
Mood	Confident, technical, ambitious, restrained, human
Visual references	Editorial layouts, brutalist typography, engineering drawings, research papers, magazine grids
Do	Hard edges, thin rules, large type, deliberate asymmetry, strong crop windows, controlled red accents
Do not	Neon cyberpunk, glassmorphism, glowing cards, gradient text, excessive 3D tilt, rounded UI everywhere
Red behavior	Signal / annotation / active state / emphasis. Never cover the entire page in red.

Identity rule

70% typography + spacing / 20% imagery / 10% red signal. The visual quality must come from layout decisions rather than decorative effects.

BLACK + WHITE + RED

Do not use pure #000000 and #FFFFFF everywhere. Use near-black and warm paper values so the interface feels sophisticated and comfortable. Red should be a small but unmistakable signal.

Dark theme palette

Dark tokens

```
:root {  
  --bg: #080808;  
  --surface: #101010;  
  --surface-2: #171717;  
  --text: #F4F4F0;  
  --text-muted: #929292;  
  --red: #FF2B2B;  
  --red-dark: #B91C1C;  
  --border: #292929;  
}
```

Light theme palette

Light tokens

```
[data-theme="light"] {  
  --bg: #F7F7F4;  
  --surface: #FFFFFF;  
  --surface-2: #EEEEEA;  
  --text: #101010;  
  --text-muted: #666666;  
  --red: #D71920;  
  --red-dark: #A50F15;  
  --border: #D7D7D2;  
}
```

Accent rules

- + Use red for active nav, section numbers, small rules, primary CTA, hover state, status dots, key metadata and selected annotations.
- + Avoid red body copy for long paragraphs.
- + Avoid gradients completely in the redesigned visual system unless a microscopic background treatment is required for an accessibility-safe decorative effect.
- + No gradient text on headings or metrics.

MAKE TYPE THE MAIN VISUAL ASSET

Use three fonts with clear roles. If the preferred fonts cannot load, fall back gracefully to system sans and monospace. Do not introduce decorative fonts outside these roles.

Role	Font	Weights / use	Behavior
Display	Syne	700-800	Name, project titles, giant statements, large numbers
Body	Instrument Sans	400-500	Descriptions, navigation, supporting copy, forms
Mono	IBM Plex Mono	400-500	Section numbers, metadata, dates, categories, status, tech labels

Suggested type scale

Element	Desktop	Mobile	Notes
Hero name	clamp(4.5rem, 10vw, 9rem)	clamp(3.2rem, 16vw, 5.8rem)	Tight leading, negative tracking
Section title	clamp(3rem, 7vw, 6rem)	clamp(2.6rem, 13vw, 4rem)	Left aligned, never centered
Project title	clamp(3rem, 6vw, 6.5rem)	clamp(2.2rem, 12vw, 4rem)	Identity statement, not card label
Body	18-20px	16-18px	Comfortable line height
Meta	11-13px	10-12px	IBM Plex Mono

Typography rules

- + Prefer left alignment for hero, section headers and project content.
- + Use scale and weight instead of gradients or shadows to create emphasis.
- + Use mono only where it communicates system/meta information. Do not turn the whole page into fake terminal text.
- + Use oversized numbers as composition, not as badges.

12-COLUMN EDITORIAL GRID

Use a 12-column grid on desktop, collapsing to 6 columns on tablet and a single column on mobile. Maintain generous outer margins. Allow selected elements to bleed or offset across the grid for personality.

Rule	Desktop	Tablet	Mobile
Max width	1400px	100%	100%
Page padding	32-56px	24-32px	18-20px
Grid	12 cols / 24px gap	6 cols / 16px gap	1 col / 16px gap
Section spacing	160-220px	120-160px	96-128px
Border radius	0-4px	0-4px	0-4px
Shadow	Minimal / optional	Minimal / optional	Avoid

Primitive components

Primitive	Style
Rule	1px border, usually muted gray; red only for active signal
Button	Sharp or 2px radius; filled red primary; black/transparent outlined secondary
Tag	Small text, no pill unless functionally necessary
Image frame	Hard crop, thin border, no glass
Section marker	Mono number + title + long horizontal rule
Card	Prefer editorial row/block over isolated rounded card

Button example: VIEW WORK ->

THE NEW CONTENT HIERARCHY

01	HERO	Immediate identity, role, one-line value proposition, work CTA, resume CTA
02	SELECTED WORK	Projects as case-study rows; work is the main character
03	PROOF	Achievements and measurable signals in huge editorial numerals
04	ABOUT	One strong statement + short supporting story
05	CAPABILITIES	Typography-driven stack / capabilities list, no chip matrix
06	JOURNEY	Minimal vertical timeline with dates and milestone facts
07	OPEN SOURCE	Compact GitHub activity + repo link
08	CONTACT	Large final statement, email, social/resume links
09	FOOTER	Small system metadata, copyright, theme and terminal entry point

Desktop visual skeleton. Mobile should preserve the hierarchy while stacking the right-side visual under the headline and keeping CTA controls reachable without excessive empty space.

LESS UI, MORE IDENTITY

The existing Hero currently combines a role rotator, stats capsules, multiple CTAs, social links, AI assistant/chat behavior and terminal access in one crowded visual area. The redesign should keep useful functionality but move most of it out of the hero.

Keep	Change
Name / role	Turn name into the largest object on the page
Resume + work CTA	Two sharp editorial actions, no pill group
AI assistant	Move behind a subtle "Ask Udeep" / command entry or Cmd/Ctrl+K utility
Social links	Small row under the primary content or footer
Stats	Move to Proof section
Role rotation	Optional, small, or replace with one strong fixed descriptor
Terminal	Keep as an easter egg / command palette entry point

Recommended hero copy hierarchy

NARIPEDDI

I build intelligent systems where machine learning meets real software.

[VIEW WORK] [RESUME]

PROJECTS BECOME EDITORIAL DOSSIERS

The current Projects component uses large cards, visual thumbnails, metrics, architecture lists and a quick-preview/modal pattern. Keep useful project detail and links, but stop rendering every project as the same rounded glass card.

Project	Recommended composition
OpsPilot	Flagship horizontal case study. Oversized 01, large image, 1st place achievement if present in current content, tech metadata, GitHub/live links.
MedLens	Split composition: image on one side, story and stack on the other. Use red annotation lines.
Emotion Detection Engine	Text-heavy research/product layout with a large visual on the right and a concise problem -> approach -> outcome structure.
algoVizZZ	Smaller experimental row. Treat it as an engineering experiment, not a hero card.
Additional projects	Continue as alternating editorial rows; do not create a repetitive 2-column card wall.

Each project should expose: category, title, one-line problem statement, 2-4 outcome facts, 3-6 tech labels, live demo, repository and optional case-study/preview action.

TURN CREDENTIALS INTO VISUAL EVIDENCE

Proof should read quickly. Use giant numerals and compact labels instead of a grid of small cards. Then give About and Capabilities enough breathing room to feel like distinct editorial chapters.

Section	Treatment
Proof	Huge metrics such as placement, prize, CGPA, open-source contribution, or other verified facts from the current content. Never fabricate or silently update figures.
About	One large statement, 1-2 supporting paragraphs, optionally a small portrait or signature element.
Capabilities	Large typographic cloud/list. Examples: MACHINE LEARNING, COMPUTER VISION, RAG, GENERATIVE AI, PYTHON, JAVA, REACT, NODE.JS, SQL, GIT. Only display technologies actually present in the current source.

Suggested proof composition

01ST ■10K 9.15 2026
GENESIS PRIZE CGPA GSSC

Use four strong facts. Each has a small mono label beneath a giant number/title.

Capabilities should avoid skill pills. Use size variation and line breaks:

MACHINE
LEARNING

COMPUTER VISION

PYTHON REACT

RAG NODE.JS

THE SECOND HALF SHOULD GET QUIETER, NOT BUSIER

Journey becomes a factual timeline. GitHub becomes proof of ongoing engineering activity. Contact becomes the emotional finish. Reduce UI density as the user approaches the bottom of the page.

Area	Design
Journey	Single vertical line, thin borders, red nodes, date + milestone. No alternating glass cards.
GitHub	Compact activity panel and repository link. Keep react-github-calendar or equivalent if already implemented.
Contact	Oversized headline: LET'S / BUILD / SOMETHING / USEFUL. Then email + links.
Footer	Small mono system metadata; terminal / command palette access can live here as an easter egg.

Contact CTA should feel like the last page of a magazine: enormous type, a lot of whitespace, one direct email action, very few competing elements.

CONTROLLED MOTION ONLY

The current code already uses Framer Motion and Lenis extensively. Keep those libraries where they provide value, but change the motion vocabulary from card physics to editorial reveals.

Interaction	Direction
Page entry	Primary typography clips/reveals upward 250-700ms.
Section reveal	A thin line draws left-to-right, then content appears.
Project hover	Image scale 1.00 -> 1.03 and text/arrow shift 6-12px.
Nav	Red underline/indicator slides between active sections.
Buttons	Red fill or underline expands on hover; no glow.
Scroll	Very light transform/parallax on selected hero/image elements only.
Terminal	Open from Cmd/Ctrl+K or a small footer/utility trigger; keep keyboard accessibility.
Reduced motion	Respect prefers-reduced-motion and disable nonessential transitions.

Do not use simultaneously: tilt + scale + shadow + glow + parallax + blur on the same element.

DESKTOP SHOULD NOT BE THE ONLY DESIGN

Breakpoint	Rules
Desktop >= 1100px	12-col editorial grid. Hero split composition. Large name can occupy 7-8 cols; visual 4-5 cols. Project layouts can alternate image/text placement.
Tablet 768-1099px	6-col grid. Reduce type scale 15-20%. Keep asymmetry but avoid tiny metadata blocks.
Mobile <= 767px	Single-column flow. Left-aligned type. Stack hero image below headline. Replace complex horizontal rows with vertical stories.
Small mobile <= 420px	Reduce decorative rules. Ensure CTAs fit or stack. Maintain strong hierarchy and 16-20px outer padding.

Mobile-specific rules

- + No horizontal overflow from oversized text. Use safe line breaks and clamp sizes.
- + Keep touch targets at least 44px high.
- + Avoid hover-only interactions; every project action must work on tap.
- + Do not turn the desktop 12-column layout into a cramped miniature. Recompose it.

REFACTOR, DON'T REWRITE BLINDLY

Use the current repository as the implementation base. The agent should inspect the actual files before editing. This map is a starting point, not permission to assume filenames or behavior that differ from the current branch.

Likely file	Action
src/index.css	Replace the current cyan/violet/glass token system with the red/black/white editorial system. Keep accessibility and reduced-motion foundations.
src/App.jsx	Keep routing, Lenis and lazy Terminal behavior unless a dependency can be simplified safely. Update page shell/background components to match the new identity.
src/components/Navbar.jsx	Rebuild nav as compact editorial header. Preserve theme switch and section anchors.
src/components/Hero.jsx	Strip the hero of stat capsules and excessive controls; keep real links and optional assistant/terminal access as utility entry points.
src/components/Projects.jsx	Rebuild into editorial rows/dossiers. Preserve real URLs, content and project actions.
Skills / Journey / GitHub / Certifications / Contact components	Replace card-heavy or pill-heavy presentations with the new section patterns. Use existing data.
SpotlightBackground / decorative components	Remove or minimize glow/aurora/particle behavior. Replace with plain field + optional grid/rule texture.
Terminal	Keep functional, but make it a hidden utility/easter egg rather than a hero centerpiece.

PREMIUM DOES NOT MEAN FRAGILE

Area	Acceptance criteria
Contrast	Maintain WCAG-friendly contrast for body and CTA states in both themes.
Keyboard	All navigation, theme switching, project links, contact actions and terminal access work without a mouse.
Focus	Visible focus rings use the red accent and remain clearly distinct from hover state.
Reduced motion	Respect prefers-reduced-motion. Avoid essential information being revealed only via animation.
Performance	Do not add a heavy animation library if an existing dependency can implement the effect. Lazy-load expensive visuals.
Images	Use responsive image sizes, meaningful alt text, predictable aspect ratios and no layout shift.
SEO	Preserve/update title, description, social metadata, favicon and semantic heading order.
Build	Run npm install / npm run build and fix every warning/error caused by the redesign.
Verification	Check desktop + tablet + mobile, dark + light, keyboard, reduced motion and project/link behavior.

Do not delete working features solely because the new design is minimal. Reposition them into the visual hierarchy.

READY TO PASTE INTO THE AGENT

The following prompt is designed to make the agent inspect the repository, plan the refactor, implement it across the complete site, test it, and polish it without stopping after a superficial recolor.

You are redesigning my existing portfolio repository, not building a new generic portfolio from scratch.

PROJECT

GitHub: <https://github.com/UdeepChowdary/myPortfolio.git>

Live site: <https://my-portfolio-bay-six-97.vercel.app/>

PRIMARY GOAL

Perform a COMPLETE visual and structural redesign of the existing portfolio around this identity:

EDITORIAL ENGINEERING / REDLINE

The result must feel like a premium editorial engineering portfolio: bold typography, hard edges, thin rules, strong hierarchy, asymmetry, generous whitespace, restrained motion, and black/white/red branding.

DO NOT simply recolor the existing cyan/violet dashboard UI. The current visual language is glassmorphism, neon telemetry, pill controls, bento cards and dashboard-style AI UI. Replace that visual language.

NON-NEGOTIABLE PRINCIPLES

1. Keep the real portfolio content, URLs, projects, achievements, certifications, GitHub links, resume link, contact behavior and existing working functionality unless a feature must be repositioned for the new hierarchy.
2. Never invent achievements, metrics, URLs, certifications, technologies or project results. Inspect the repository and use the existing source of truth.
3. Keep dark mode and light mode.
4. Keep responsive behavior for desktop, tablet and mobile.
5. Keep accessibility, keyboard interaction and prefers-reduced-motion support.
6. Run the real project build before finishing and fix errors.
7. Do not leave dead components, broken links or placeholder content.

VISUAL SYSTEM

Dark theme:

```
--bg #080808
--surface #101010
--surface-2 #171717
--text #F4F4F0
--text-muted #929292
--red #FF2B2B
--red-dark #B91C1C
--border #292929
```

Light theme:

```
--bg #F7F7F4
--surface #FFFFFF
--surface-2 #EEEEEA
--text #101010
--text-muted #666666
--red #D71920
--red-dark #A50F15
--border #D7D7D2
```

TYPOGRAPHY

Display: Syne 700-800

Body: Instrument Sans 400-500

Mono: IBM Plex Mono 400-500

Use the display font for the name, project titles, large statements and key numbers.

Use Instrument Sans for normal reading text.

Use IBM Plex Mono only for metadata, section numbering, dates, categories and status labels.

Do not use monospace as fake decorative body text.

SHAPE / SURFACE RULES

- No glassmorphism.
- No neon glow.
- No cyan/violet gradients.
- No gradient text.
- No large rounded glass cards.
- Buttons should be sharp or max 2-4px radius.
- Use 1px borders and horizontal rules as a major layout device.
- Use minimal/no shadows.
- Red is a SIGNAL, not a background color for entire sections.
- Avoid a repetitive card grid.

GLOBAL LAYOUT

- Desktop max width approximately 1400px.
- 12-column grid with generous outer margins.
- Tablet: 6-column composition.
- Mobile: single-column composition.
- Left-align most major typography.
- Prefer asymmetrical editorial layouts over symmetrical dashboard grids.
- Section headings use a small mono number plus a long horizontal rule.

NEW HOMEPAGE ORDER

01 HERO
02 SELECTED WORK
03 PROOF
04 ABOUT
05 CAPABILITIES
06 JOURNEY
07 OPEN SOURCE
08 CONTACT
09 FOOTER

HERO

Replace the current crowded hero with an identity-first composition.

Recommended hierarchy:

AI / ML ENGINEER

UDEEP

CHOWDARY
NARIPEDDI

I build intelligent systems where machine learning meets real software.

[VIEW WORK] [RESUME]

Use a split composition on desktop: typography on the left, a strong portrait/product/abstract visual window on the right.

Do not put every achievement, stat chip, social icon and AI chat interface in the hero.

Move stats to PROOF.

Move terminal/AI assistant to a utility layer such as Cmd/Ctrl+K, a small command entry, or footer trigger while keeping it accessible.

NAVBAR

Rebuild the navbar as:

UDEEP. WORK ABOUT STACK CONTACT THEME

Keep it compact. Use a thin border and strong spacing. Active section gets a small red indicator/underline. Avoid pill nav.

SELECTED WORK

Projects are the main content.

Do not render every project as the same rounded card.

Use editorial case-study rows / blocks with:

- oversized project number
- project title
- category
- one-line problem/value statement
- 2-4 factual outcome points if present
- tech metadata
- GitHub/live links
- optional case-study/preview interaction

Vary the composition between projects. Example:

OpsPilot -> large horizontal flagship

MedLens -> split image/text
Emotion Detection Engine -> research/product editorial treatment
algoVizZZ -> smaller experiment row

Preserve all actual project data from the repository.

PROOF

Replace card grids with giant typography and verified evidence.
Show only facts that exist in the repo/current content.
Examples may include competition placement, prize, CGPA or open-source contribution if those are already stored in the project.
Use large numbers + tiny mono labels + horizontal rules.

ABOUT

Do not make a standard centered About Me card.
Use a giant statement with a short supporting story.
Example visual structure:
01 / ABOUT
I build intelligent systems where machine learning meets practical software engineering.

Keep actual biography details from the repo.

CAPABILITIES

Do not use a wall of skill pills.
Create a typographic list/cloud where important capabilities are large and secondary items are smaller.
Examples: MACHINE LEARNING, COMPUTER VISION, RAG, GENERATIVE AI, PYTHON, JAVA, REACT, NODE.JS, SQL, GIT.
Only display technologies that exist in the current project data.

JOURNEY

Keep the timeline idea but remove glass cards and glowing nodes.
Use a single vertical line with red nodes and factual dates/milestones.

OPEN SOURCE

Keep GitHub activity/calendar or equivalent existing feature, but make it compact.
It should support the story, not dominate the page.

CONTACT

Make the final section visually huge and quiet.
Use:
LET'S
BUILD
SOMETHING
USEFUL.

Then show the real email/contact links from the repository.
The section should feel like a magazine back page: huge type, large whitespace, direct CTA.

FOOTER

Small, precise, mono metadata. Theme control and terminal/command access can live here.

MOTION

Use existing Framer Motion / Lenis where useful.
Change the motion language:
- hero type reveal upward
- rules draw left-to-right
- project image hover scale 1.00 -> 1.03
- text/arrow moves 6-12px
- active nav indicator slides
- subtle image parallax only on selected large visuals
- respect reduced motion
Do not stack tilt + glow + parallax + blur + shadow on the same component.

COMPONENT REFACTOR

Inspect the actual repo before editing. Likely areas include:
src/App.jsx
src/index.css
src/components/Navbar.jsx
src/components/Hero.jsx
src/components/Projects.jsx
src/components/Skills.jsx or skill-related component
src/components/JourneyTimeline.jsx
src/components/Terminal.jsx

src/pages/Home.jsx
and related styling files.
Do not assume the exact current structure if the branch differs. Use
the real repository.

For the global CSS:

- replace cyan/violet token system
- remove glassmorphism primitives
- remove pill-first button system
- establish editorial type scale
- establish 12-column grid
- establish sharp button and rule primitives
- preserve accessibility and reduced motion

FOR BACKGROUNDS

Remove large glowing aurora / spotlight / particle decoration.
A plain black/paper field with a subtle grid/rule texture is enough.
If SpotlightBackground exists only for decoration, simplify or
replace it rather than keeping a visible neon effect.

RESPONSIVE

Desktop >= 1100px: 12-column editorial grid.
Tablet 768-1099px: 6-column grid.
Mobile <= 767px: single column, left aligned.

On mobile:

- stack the hero visual below the headline
- stack project blocks vertically
- keep large type but clamp it safely
- make CTA buttons full-width or stacked where needed
- remove hover-only interactions
- ensure no horizontal overflow

ACCESSIBILITY

- WCAG-friendly contrast in both themes
- visible keyboard focus
- 44px+ touch targets
- semantic headings
- meaningful image alt text
- reduced-motion support

PERFORMANCE

- do not add a heavy new dependency unless necessary
- reuse existing Framer Motion / Lenis / Lucide dependencies when possible
- lazy load expensive visuals
- avoid layout shifts

SEO

Preserve or improve title, meta description, Open Graph metadata,
semantic heading order and favicon.

IMPLEMENTATION PROCESS

1. Inspect the entire current repo and identify the exact component/data architecture.
2. Create a concise internal redesign plan.
3. Refactor the global design tokens first.
4. Refactor navbar and page shell.
5. Completely redesign hero.
6. Completely redesign projects.
7. Refactor proof/about/capabilities.
8. Refactor journey/open-source/contact/footer.
9. Integrate the existing terminal/AI utility into the new identity instead of deleting it.
10. Test dark/light theme behavior.
11. Test desktop/tablet/mobile.
12. Test keyboard focus and reduced motion.
13. Run npm run build and fix every issue.
14. Remove obsolete CSS/classes/components that are no longer used.
15. Review the final page for consistency: type scale, spacing, red usage, alignment and motion.

FINAL QUALITY BAR

The result should look intentionally art-directed, not
template-generated.

A recruiter should understand who I am and what I built within
seconds.

The page should feel more like a premium design publication or
engineering studio site than a dashboard.

The red accent should be memorable precisely because it is

restrained.

Projects and evidence should dominate.

Visual effects should support hierarchy, never compete with it.

Do not stop after changing colors. Complete the redesign across the full website.

HAND THIS PAGE TO THE AGENT AS THE DEFINITION OF DONE

Check	Done when...
Brand	Black/white/red identity is visible immediately in both themes.
Typography	Syne / Instrument Sans / IBM Plex Mono roles are consistent and deliberate.
Hero	No crowded dashboard. Name dominates. Two main CTAs. Strong visual on the right.
Projects	Editorial dossier layouts, varied compositions, real links intact.
Proof	Large facts, not card clutter. Only verified repo data.
Skills	No chip wall. Typography-driven capabilities.
Journey	Minimal factual timeline.
GitHub	Compact supporting proof.
Contact	Huge final CTA and direct contact.
Dark/light	Both themes look intentionally designed, not inverted.
Motion	Controlled, purposeful, reduced-motion friendly.
Mobile	Recomposed, not merely squashed.
Build	npm run build passes.
Cleanup	No dead visual-system classes, no unused imports caused by redesign.

Source verification used for this brief

GitHub repository: <https://github.com/UdeepChowdary/myPortfolio> | Live site: <https://my-portfolio-bay-six-97.vercel.app/> |
Repository documents reviewed: DESIGN.md, PRODUCT.md, src/App.jsx, src/index.css, src/components/Hero.jsx,
src/components/Projects.jsx. Verification date: 2026-10-02.

Important: the repository content may evolve. The implementation agent must treat the current checked-out branch as the final source of truth for facts and file paths.
